

CONTENTS

INTRODUCTION

1 - 18

PART – 1

CHAPTER 1

Neonatal functional pinealectomy by light shows adverse effect on adult testis functions and alters neuroendocrine homeostasis

Summary

19 - 51

CHAPTER 2

Simultaneous melatonin administration to rat neonates fails to correct the negative impact of light induced functional pinealectomy on adult testis functions and hormonal profiles

Summary

52 - 77

CHAPTER 3

Concomitant hypothyroidism prevents the adverse effects on adult testes functions induced by neonatal functional pinealectomy by exposure to light and shows mixed effects of light and hypothyroidism on hormone profiles.

Summary

78 - 102

CHAPTER 4

Simultaneous corticosterone administration to neonates subjected to light induced functional pinealectomy prevents the adverse effects on early germ cell survival but not on spermatids and sperms in adult testis.

Summary

103-135

PART – 2

CHAPTER 5

Neonatal melatonin treatment has favourable quantitative and qualitative influence on adult ovarian functions in the rat.

Summary **136–159**

CHAPTER 6

Neonatal hypothyroidism retards body and ovarian growth and hampers adult ovarian functions in the rat

Summary **160–180**

CHAPTER 7

Simultaneous melatonin administration is able to resist the negative influence of neonatal hypothyroidism on folliculogenesis but not on body weight and, ovarian weight and volume

Summary **181–203**

GENERAL CONSIDERATION AND POST-SCRIPT

204–212

BIBLIOGRAPHY

213–267
