

List of Figures

| | | Page |
|----------|---|------|
| Fig.1.1 | Relation between daytime growing-season temperature and atmospheric CO ₂ for grasses | 6 |
| Fig.1.2 | Schematic diagram showing palaeo CO ₂ concentration variation obtained from various studies | 8 |
| Fig.2.1 | Geographical extension of Siwalik and Satpura (Gondwana) Basins | 14 |
| Fig.2.2 | Geological map of the Indian sections in the Himalayan Foreland Basin | 16 |
| Fig.2.3 | Correlation of magnetic stratigraphy with GPTS | 21 |
| Fig.2.4 | Sedimentation in fluvial system and formation of soil | 28 |
| Fig.2.5 | Soil carbonate nodules in palaeosol bed | 29 |
| Fig.2.6 | Mechanisms of nodule formation | 30 |
| Fig.2.7 | Thin sections of soil carbonate | 37 |
| Fig.3.1 | Carbon and oxygen isotope ratio variation in soil carbonate and carbon isotope ratio of associated organic matter taken from various depths within individual soil profiles (total 6) from Ranital section, Kangra valley | 53 |
| Fig.3.2 | Composite plot of isotope ratios against age of soil carbonate nodules from three sections (Ranital, Kotla and Haripur Khol) | 54 |
| Fig.3.3 | Cross plot of estimates of C ₄ plant abundance from two phases, soil carbonate and soil organic matter from Haripur Khol section | 55 |
| Fig.3.4 | Variation of $\Delta(\delta^{13}\text{C})$ ($\delta^{13}\text{C}$ soil carbonate – $\delta^{13}\text{C}$ organic matter) through time | 56 |
| Fig.3.5 | Comparison between abundance variation of <i>G. bulloides</i> in Arabian Sea and oxygen isotope ratio variation of soil carbonates from Siwalik through time | 61 |
| Fig.4.1 | Rounded sandstone nodules in sandstone bed | 71 |
| Fig.4.2 | Ellipsoidal sandstone nodules with long axis parallel to bedding | 72 |
| Fig.4.3 | Thin section of sandstone nodule | 72 |
| Fig.4.4 | Carbon and oxygen isotope ratio of carbonate cement in a sandstone nodule | 73 |
| Fig.4.5 | Composite plot of isotope ratios against age for sandstone nodules from Mohand Rao and Haripur Khol sections | 74 |
| Fig.4.6 | Time variation of carbon isotope ratio of soil carbonate nodules from Mohand Rao section | 75 |
| Fig.4.7a | Detrital carbonate in sandstone | 76 |
| Fig.4.7b | Thin section showing blocky micritic grains possibly representing intrabasinal soil carbonate | 77 |

| | | |
|----------|--|-----|
| Fig.4.8 | Correlation between the carbon isotope ratios of soil carbonates and early diagenetic carbonate cements of sandstones | 78 |
| Fig.4.9 | Comparison between oxygen isotope ratio of CCN from Pakistan and Indian sections | 79 |
| Fig.5.1 | Crystal structure of clay minerals | 87 |
| Fig.5.2 | X-ray diffractograms of clays made from oriented samples of less than 2-micron size | 89 |
| Fig.5.3 | Hydrogen isotope ratio of pedogenic clays from Haripur Khol section | 91 |
| Fig.5.4 | Abundance variation of different clay species through time in Haripur Khol section | 94 |
| Fig.5.5 | Comparison of various climate proxies with hydrogen isotope ratio of clay minerals obtained from Siwalik soils | 98 |
| Fig.6.1a | Soil carbonate nodules in Denwa Formation | 103 |
| Fig.6.1b | Preserved root mold at Denwa Formation | 104 |
| Fig.6.2 | Mudstone bed on which palaeosol formed is sandwiched between two sandstone beds (from Siwalik section of Ranital) | 105 |
| Fig.6.3a | Palaeosol bed between sandstone and conglomerate from Bagra Formation | 106 |
| Fig.6.3b | Frontal view of palaeosols bed in Bagra Formation | 107 |
| Fig.6.3c | Top view of rhizcretion | 107 |
| Fig.6.4 | Isotope ratio variation in soil profile | 108 |
| Fig.6.5 | Atmospheric CO ₂ concentration variation through time | 115 |
| Fig.7.1a | Thin section showing calcite cement filling the pore space of sandstone samples | 124 |
| Fig.7.1b | Remnant of quartz grain after corrosion by calcite cement in medium grained sandstone | 124 |
| Fig.7.1c | Corrosion of K-feldspar grain by calcite cement | 125 |
| Fig.7.2 | Oxygen isotope ratio variation of carbonate cement of sandstone and soil carbonate through time from Surai Khola section | 129 |
| Fig.7.3 | Carbon isotope ratio of carbonate cement from Surai Khola sandstone | 130 |
| Fig.7.4 | X-ray diffraction pattern of less than 2 <i>micron</i> size clay minerals separated from Surai Khola sandstone | 135 |
| Fig.7.5 | Time variation of smectite and illite abundances from Surai Khola sandstone | 136 |
| Fig.8.1 | Relation between carbon isotope ratio of fresh phytoliths and plant tissue | 143 |
