

ACKNOWLEDGMENTS

This work is the end-result of encouragements received from a number of sources. I am respectfully grateful to all of them, although I find it impossible to acknowledge my debt to each one separately.

In the first place, as a native of India, I am highly obliged to Shikshan Prasarak Mandali (The Society for the Advancement of Education), Poona, India, for taking the necessary initiative towards my graduate work in the United States of America.

Secondly, I consider myself very fortunate in being able to receive the direction of some of the outstanding psychologists in the United States. They are: Prof. H. E. Garrett, Chairman, Department of Psychology, Columbia University; Prof. C. R. Carpenter, Chairman, Department of Psychology, and Director, the Instructional Film Research Program, The Pennsylvania State College; Prof. Otto Klineberg, Columbia University; and Prof. F. S. Keller, Columbia University. I am also very thankful to Prof. C. J. Warden, Columbia University, and Prof. W. M. Lepley, The Pennsylvania State College, for their invaluable suggestions towards the experimental design. Thus, the study was planned and completed under the joint sponsorship of Columbia University and the Instructional Film Research Program, at The Pennsylvania State College.

The actual research was carried out at The Pennsylvania State College under a Graduate Navy Research Fellowship awarded to me by the Instructional Film Research Program. The funds for this Fellowship were provided by the Special Devices Center of the office of Naval Research. I am especially grateful to Prof. C. R. Carpenter, Director of the Instructional Film Research Program, for making this fellowship available

to me. In fact, the tower of strength behind this project was Prof. Carpenter himself.

To the research staff of the Instructional Film Research Program, I am indebted for a degree of cooperation and interest which would be difficult, I believe, to find elsewhere. Mr. L. P. Greenhill solved all the executive problems associated with this study as if they were his own. Mr. H. P. Miller, and Mr. D. P. Duvall, of the Motion Picture and Recording Studio at The Pennsylvania State College, undertook to make the different film versions. Mr. E. P. McCoy, Dr. C. J. McIntyre, and Dr. J. J. Stein made available to me their previous experience in scripting and testing. Mr. R. W. Watkins, and Dr. Louis Checov took active part in the statistical analysis of the data. Prof. J. F. Hall, Chairman of the Undergraduate Psychology Teaching Committee at The Pennsylvania State College, secured the cooperation of about 400 Psychology-2 students to work as subjects for the experiment.

Last, but in no way least, is the prompt and efficient handling of such matters as project correspondence, preparation of manuscripts, and machine computations. The credit for this goes to the excellent secretarial staff of the Instructional Film Research Program. The multi-lith printing of this dissertation was made possible through the cooperation of the Secretarial Service, State College, Pa., and the Office Services of The Pennsylvania State College. Many thanks are due to Mrs. Helen Yarnell of the Secretarial Service, and to Mr. K. J. Pahel, of the Office Services of the College, for completing the work at a very short notice. It became easier to "say it in figures", thanks to the help of Mr. J. A. Murnin in the graphical representation of the data.
