CHAPTER V :

FACTOR ANALYSIS

- 5.1 Introduction
- 5.2 Principal Component Factors (OCDQ)
- 5.3 Four Factor Relation Solution
- 5.4 Principal Component Factors (OCDQ, Personality Factors, PCI and Dogmatism)
- 5.5 The Eleven Rotated Factor Solution
- 5.6 Conclusion

5.1 INTRODUCTION

The significant correlations that each item bore with the sub-test were taken to mean that the item really belonged to the cluster of items designated by the sub-test. The OCDQ (Baroda Form I) used in the study has 12 sub-tests or dimensions. Before the study is concluded, it would be worthwhile to identify the principal factors. This would necessitate factor analysis at the sub-test level. It is intended to do this by computing a 12x12 correlation matrix based on the 12 sub-test scores of **4s44** respondents, examining the factor loadings to determine the degree to which each sub-test is saturated with each of the factors and applying to four varimax factor solution to find out which sub-test or sub-tests load high on each of the four factors. The results of factor analysis on above lines will be presented in subsequent sections of this chapter.

5.2 PRINCIPAL COMPONENT FACTORS (OCDQ)

As a preliminary step in factor analysing of the sub-tests a 12x12 inter-correlation matrix was computed. The inter-correlations of sub-tests give a picture of the internal structure of the test (the OCDQ). ¹The intercorrelations are given in Table 5.1.

OCDQ(Baroda Form I) Sub-tests	Dis- engage- ment	Hind- ran- ce	Inti- macy	Esp. rit	Aloof ness	Produ- ction Empha-	Consi- dera- tion	Thru- st	Non- graded order	Feed- back	Human- Rela- tions	Autonomy

-

The inter-correlations of the sub-tests of the OCDQ (Baroda Form I) show that each sub-test measures a relatively different "thing" or type of behaviour. The coefficients of correlation vary from -.01 to +.61.

The next step is to factor the above Correlation Matrix. Here, the Principal-Axes Method, as reported by Fruchter (1967:280) will be followed. This method of factoring the Correlation Matrix has certain distinct advantages which deserve to be noted. Firstly, each factor extracts the minimum amount of variance and gives the smallest possible residuals. Secondly, the Correlation Matrix is condensed into the smallest number of orthogonal factors. Thirdly, it has the advantage of giving a mathematical unique (least squares) solution for a given table of correlations. Lastly, the process of further extracting of principal components could be stopped when the amount of variance goes on decreasing.

In the discussion on the original principal component matrix (12x4), the term "factor loading" will be used. It would be worthwhile to clarify this term.Sharma (1973:215) explains the term in the following words : "The factor loading which a given sub-test receives on a particular factor shows the extent to which the sub-test measures the same type of behaviour as is represented in a more general term by the factor itself. Whenever a sub-test yields a high factor loading on a given factor, be it either positive or negative, that sub-test can be viewed as a 'good' measure of the factor. Alternatively, if a sub-test secures only a zero loading on a factor or a value near zero, that sub-test obviously is not measuring the same thing as the factor is measuring."

The details of extraction of the factors based on the original Correlation Matrix (vide- Table 5.1) are presented in the <sup>O</sup>riginal Principal Component Factor Matrix in Table 5.2 given on the next page.

The table constitutes the Original Principal Component Matrix (12x4). It shows loadings on four factors that are extracted. The 'Eigen Values' of each of these four factors are 36.99, 13.70, 11.90 and 9.00 respectively.A factor is considered to be of lesser importance if its 'Eigen Value' is less than 1.00. Applying this criterion, all the four factors were considered for Varimex Rotation Solution. Kaiser's (1958) programme was applied for the rotation of the factors.

Table 5.2 : Original Principal Component Factor Matrix (12x4)

Note: Loading beyond + .30 are considered significant.

338

From the above table, it is clear that four dimensions, viz., 'disengagement', 'hindrance', 'aloofness' and 'human relations' load high on Factor I, while 'thrust' and 'Non-graded order' load high on Factor II, 'production Emphasis' load high on Factor III and 'Feedback' and 'intimacy' load high on Factor IV. Sharma (1973 : 218) in his doctoral study reached the conclusion that a high score on 'production emphasis' indicated job-oriented behaviour. It will be noticed that the loading in this factor is smaller on dimensions of 'intimacy', 'considerations' and 'human relations' which bring about social need satisfaction. The Joading on 'production emphasis' indicates a kind of jobsatisfaction emanating from task-accomplishment. This factor may, therefore, be named as '<u>Task-fulfilment</u>'.

'Feedback', 'esprit' and 'intimacy' load high on Factor IV. They are conducive to improvement of teacher morale, both intimacy and free flaw of communication are necessary to keep teachers satisfied socially and emotionally which contribute to their morale. So, the Factor IV may be named as 'morale' factor.

The Factor I indicates high loading in the case of

339

'disengagement', 'hindrance', aloofness' and 'non-graded order' (or hierarchical behaviour). They are negative behaviour resulting from closed administrative behaviour. So, this Factor I may be named 'administrative behaviour' or 'administrative closedness'.

2

The Factor II shows high loading on dimensions of 'consideration' and 'thrust'. Consideration denotes social needs satisfacton, and 'thrust' is also a behaviour which motivates teachers internally which also works towards psychological needs satisfaction. Therefore, the Factor II may be named as 'psycho-social need satisfaction'.

In fine, keeping in mind the above factor rotation solution, one might observe that institutional behaviour that occurs in the sampled 128 secondary schools of Gujarat is characterised by four general factors. Sharma's (1973) general factor of 'job satisfaction' and Halpin's 'social control' gets here the name of 'task fulfilment'. Another general factor identified by Sharma was 'organizational control' which was in Halpin's factor analysis was called 'social control' gets here the name of "administrative orientation or closedness'. The third general factor was called by both Sharma and Halpin as 'esprit' which, here, is called 'morale'. The fourth factor was designated as 'social control' both by Sharma and Halpin, but here it gets a different label - 'the psycho-social needs'.

Thus, the four principal factors extracted in the present study are: Administrative Orientation or Closedness, Psycho-social Need Satisfaction, Task-Fulfilment and Morale.

## 5.3 FOUR FACTOR ROTATION SOLUTION

In the previous section the principal four factors were extracted and named. A factor is considered to be of lesser importance if its 'Eigen Value' is less than 1.00. Applying this criterion, an attempt will now be made to consider all the previously extracted four factors for Varimax Solution. Kaiser's (1959) computer programme will be applied for the rotation of the solution. In Table 5.3, the rotated factor matrix with dimensions loadings of all the four factors are given.

|     | Dimensions                                                                                                     |       | Facto | rs    |       |
|-----|----------------------------------------------------------------------------------------------------------------|-------|-------|-------|-------|
|     | ۱۹٬۰۰۰ ۰۰۰ ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ - ۱۹٬۰۰ | 1     | II    | III   | IV    |
| 1.  | Disengagement                                                                                                  | 44    | .62   | 42    | 23    |
| 2.  | Hindrance                                                                                                      | 50    | .63   | 27    | •13   |
| 3.  | Intimacy                                                                                                       | 11    | 85    | 01    | 05    |
| 4.  | Esprit                                                                                                         | .16   | 74    | .06   | 25    |
| 5.  | Aloofness                                                                                                      | 67    | • 34  | 39    | .04   |
| 6.  | Production<br>Emphasis                                                                                         | •17   | 04    | .10   | •88   |
| 7.  | Consideration                                                                                                  | .82   | =.15  | 10    | 26    |
| 8.  | Thrust                                                                                                         | •83   | .05   | 09    | • 27  |
| 9.  | Non-graded order                                                                                               | 20    | 29    | •74   | .10   |
| 10. | Feedback                                                                                                       | •14   | .04   | •77   | 10    |
| 11. | Human Relations                                                                                                | •50   | 58    | •21   | .11   |
| 12. | Autonomy                                                                                                       | •41   | 19    | •26   | 59    |
|     | Percent common<br>variation                                                                                    | 23.40 | 22.20 | 14.06 | 11.92 |
|     | Percent<br>Total variation                                                                                     |       | 31.01 | 19.64 | _     |

Table 5.3 : Rotated Factor Matrix ( 12 x 4 )

The discussion of the results is based on varimax rotated factor matrix. In interpreting a factor, the investigator considered only those variables which had loadings greater than .30 value.

.

•

.

Anastasi (1958) has pointed out, "In interpreting a factor, we consider only those items whose loading with that factor exceeds some minimum. The interpretation of varimax factors has been centred around only those variables which had loadings greater than absolute value of .30."

The name and number of the components are given in the correlation matrix, the components and the rotated varimax factor loadings are given right in the beginning of the discussion of each factor.

#### VARIMAX FACTOR (I

The significant loadings of varimax factor I, are arranged in descending order in Table 5.4, for the sake of convenience.

Table 5.4 : Varimax Factor I

| Variables       | Loading |
|-----------------|---------|
| Thrust          | •83     |
| Consideration   | •82     |
| Human Relations | •50     |
| Autonomy        | .41     |
| Disengagement   | 44      |
| Hindrance       | 50      |
| Aloofness       | 67      |

343

The Varimax Factor I is characterised by significant loadings for seven variables. Four variables of the factor loadings are found to be positive whereas three variables are negative. The percent common variance covered by this factor is 23.40. The significant loadings were shared by the variables Thrust .83, Consideration .82, Human Relations.50, Autonomy .41, and and an and a consideration this factor is mostly dominated by Thrust and Consideration, this factor can be named as 'Thrust and Consideration'.

## VARIMAX FACTOR II

The varimax factor II is summarised in Table 5.5 : Table 5.5 :

| Variables       | Loading |
|-----------------|---------|
| Hindran ce      | •63     |
| Disengagement   | •62     |
| Aloofness       | •34     |
| Human Relations | 58      |
| Esprit          | 74      |
| Intimacy        | 85      |

345

The Varimax Factor II is characterised by significant loadings of six variables. Though three variables have positive loadings, the remaining three are negatively loaded. The percent common variance covered by this factor is 22.20. The significant loadings were shared by variables, Hindrance .63, Disengagement.62, Aloofness .34, Human Relations -.58, Esprit -.74, and Intimacy -.85. 'Since this factor is mostly dominated by Intimacy, this factor can be named as 'Intimacy'. Halpin (1963) has also identified 'Intimacy' as one of the factors of Organizational Climate.

## VARIMAX FACTOR III

The significant loadings of the third varimax factor are being summarised in Table 5.6.

Table 5.6 : Varimax Factor III.

| Variables        | Loading |
|------------------|---------|
| Feedback         | •77     |
| Non-graded order | •74     |
| Aloofness        | 39      |
| Disengagement    | 42      |

This Varimax Factor is characterised by significant loadings for four variables. Though two variables have

positive loadings, the remaining two variables are negatively loaded. The percent common variance covered by this factor is 14.06. The significant loadings were shared by variables communication .77, Non-graded order .74, Aloofness -.39 and Disengagement -.42. Since this factor is mostly dominated by "Feedback" and "Non-graded order" the varimax factor III can be named as "Feedback" and "Non-graded order".

## VARIMAX FACTOR IV

1

The significant loadings of the varimax Factor IV arranged in descending order are given in Table 5.7 below :

Table 5.7 : The Varimax Factor IV.

| Variables           | Loadings |
|---------------------|----------|
| Production Emphasis | •88      |
| Autonomy            | 59       |

The Varimax Factor IV is characterised by significant loadings for only two variables. Though one variable has positive loadings, the other one is negatively loaded. The percent common variance covered by this factor is 11.92. The significant loadings were shared by the variables Production Emphasis .88 and H\_ dow and To Autonomytion -.59. Since this factor is mostly dominated by Production Emphasis, this factor can be named as 'Production Emphasis'. Halpin (1963) has also identified 'Production Emphasis' as one of the factors of Organizational Climate.

# 5.4 PRINCIPAL COMPONENT FACTORS (OCDQ, PERSONALITY FACTORS, PCI AND DOGMATISM)

The previous two sections were devoted to factor analysing the OCDQ (Baroda Form II) at sub-test level. The organizational Climate of secondary schools, in the present study, constitutes the dependent variable, whereas the 16 personality Factors, the Pupil Control Ideology and Dogmatism (belief systems) form its three independent variables. A factor analysis of all the dimensions of the OCDQ, the 16 P.F., the PCI and Dogmatism will now be taken up. Here also the same procedures of analysis will be used.

The preliminary step, as before, will be to compute the comprehensive correlation matrix. This is done in Table 5.8. The next step is to repeat the procedures followed in Section 5.2 and prepare Original Principal Component Factor Matrix (30 x 11) which would help in condensing the original 30 variables into eleven factors. This is done in Table 5.9. Table 5.8 : The Comprehensive Correlation Matrix ( 30x30 )

| Variat<br>bles<br>e      | Dis-<br>enga-<br>ge- | Hind-<br>ran-<br>ce | In to-<br>macy | Esp-<br>rit | Aloof<br>ness   | Prod.<br>Emph-<br>asis | Consi-<br>dera-<br>tion | Thru-<br>st | Non-<br>graded<br>order | Feed<br>back | Human<br>Rela-<br>tions | Auto-<br>nomy | Pers.<br>A | Pers.<br>B  | Pers.<br>C  |

#### 5.5 THE ELEVEN ROTATED FACTOR SOLUTION

The Original Principal Component Matrix (30x11) with factor loadings of eleven dominant factors is given in Table 5.10 on the next page. The 'Eigen Values' of each of these eleven factors are 15.29, 6.95, 6.19, 5.54, 4.95, 4.32, 3.94, 3.73, 3.55, 3.37 and 3.31 respectively. For varimax rotation Kaiser's (1959) computer programme was applied. The rotated factors matrix with factor loadings of eleven factors is given in succeeding tables.

## THE VARIMAX FACTOR I

The significant loadings of the first out of the total varimax factors are being summarised in Table 4.11 below :

| Table | 5. | 11 | : | The | Varimax | Factor | 1 |

,

Table 5.10 : Rotated Factor Matrix ( 30 x 11 )

,\*

This factor is characterised by significant loadings for seven variables. Three variables of the factor loadings are found to be positive whereas four variables are negative. The percent common variance covered by this factor is 10.08. The significant loadings were shared by variables Hindrance .62, Disengagement .57, Aloofness .33, Non-graded Order -.32, Human Relations -.54, Esprit -.73 and Intimacy -.83. Since this factor is negatively dominated by high significant loading on the dimensions of Intimacy and Esprit, this factor can be named as 'Intimacy' and 'Esprit'.

#### THE VARIMAX FACTOR II

The significant loadings of varimax factor II are summarised in Table 5.12.

Table 5.12 : Varimax Factor II

| Variables | Loading |
|-----------|---------|
| Pers. Q2  | .71     |
| Pers.PCI  | •66     |
| Pers. Q3  | •52     |
| Pers. M   | •38     |

This factor is characterised by significant loadings only on four variables. All the factor loadings are found to be positive. The percent common variance covered by this factor is 8.60. Since significant loadings were dominated by self sufficient, it can be called 'Self Sufficient'.

## THE VARIMAX FACTOR III

The significant loadings on varimax factor III are summarised in Table 5.13.

Table 5.13 : Varimax Factor III.

| Thrust.82Consideration.81Human Relations.52Autonomy.42Disengagement48Hindrance55Alcofness69 | Variables       | Loadings |

| Aloofness69                                                                                 | Hindrance       | 55       |
|                                                                                             | Aloofness       | 69       |

This factor is characterised by significant loadings on seven variables. Four variables are found to be positive whereas three variables are negatively loaded. The per cent common variance covered by this factor is 5.65. The significant variables were shown by variables Thrust .82, Consideration .81, Human Relations .52, Autonomy and The lass .42, Disengagement -.48, Hindrance -.55 and Aloofness -.69. The significant loadings were shared by Thrust and Consideration. This factor can be named as "Thrust"and"Consideration"

## THE VARIMAX FACTOR IV

The significant loadings of varimax factor IV are summarized in Table 5.74.

Table 5.14 : Varimax Factor IV.

| Pers. Q <sub>4</sub> .36                  | Pers. | Е              | • 68     |
| · ·                                       | Pers. | N              | •67      |
| DOT 34                                    | Pers. | Q <sub>4</sub> | • 36     |
| • 74                                      | PCI   |                | • 34     |

This factor is characterised by significant loadings only on four variables. All the factor loadings are found to be positive. The percent common variance covered by this factor is 5.25. The significant loadings were shared by variables PE .68, PN .67, Q<sub>4</sub> .36 and PCI .34. The significant loadings were shared by Dominant and sophisticated. This factor is named as "Dominant and Sophisticated".

#### THE VARIMAX FACTOR V

The significant loadings of the fifth varimax factor are being summarised in Table 5.15.

Table 5.15 : The Varimax Factor V

| Variables           | Lo adings |
|---------------------|-----------|
| Production Emphasis | •83       |
| Autonomy            | 61        |

This factor is characterised by significant loadings only on two variables. One variable is found to be positive and the other variable is negatively loaded. The per cent common variance covered by this factor is 5.05. <sup>1</sup>he significant loadings were shared by variables Production Emphasis .83 and Autonomy -.61. The significant loadings were shared by Production Emphasis. This factor can be named as 'Production Emphasis'.

## THE VARIMAX FACTOR VI

The significant loadings of the sixth varimax factor are being summarised in Table 5.16.

Table 5.16 : The Varimax Factor VI.

| Variables | Loadings |
|-----------|----------|
| Pers. A   | 35       |
| Pers. G   | 44       |
| Pers. 0   | 62       |
| Pers. I   | 69       |

This factor is characterised by significant loadings only on four variables. All the factor loadings are found to be negative. The percent common variance covered by this factor is 5.02. The significant loadings were showed by variables Pers.A -35, Pers.G -.44, Pers.O -.62 and Pers.I -.69. The significant loadings were shared by Tough and Confident. This factor can be named as "Tough and Confident".

#### THE VARIMAX FACTOR VII

The significant loadings of varimax factor VII are given in Table 5.17.

Table 5.17 : The Varimax Factor VII.

| Loadings |
|----------|
| 43       |
| 69       |
| 69       |
|          |

This factor is characterised by significant loadings only on three variables. All the factor loadings are found to be negative. The percent common variance covered by this factor is 5.00. The significant loadings were shared by variables Pers.A -.43, Pers.F -.69 and Pers.M -.69. Since this factor is dominated by high significant loadings on Silent and Conventional, it can be called "Silent and Conventional".

#### VARIMAX FACTOR VIII

The significant loadings of the eighth varimax factor are being summarized in Table 5.18.

Table 5.18 : The Varimax Factor VIII.

| Vari <b>a</b> bles | Loadings |
|--------------------|----------|
| Non-graded order   | •73      |
| Pers.C             | •73      |
| Feedback           | • 68     |
| Aloofness          | 32       |
| Disengagement      | 43       |

The factor is characterised by significant loadings only on five variables. Three variables are found to be' positive and the other variables are negatively loaded. The percent common variance covered by this factor is 4.86. The significant loadings were shared by variables Non-graded order .73, Pers. C. .73, Feedback .68, Aloofness -.32 and Disengagement -.43. Since this factor is highly dominated by high significant loadings on Non-graded order and Mature, it can be called "Non-graded order" and "Matured".

## THE VARIMAX FACTOR IX

The significant loadings of varimax factor IX Ave given in Table 5.19.

Table 5.19 : The Varimax Factor IX.

| Variables            | Loadings |
|----------------------|----------|
| Pers. Q <sub>1</sub> | •74      |
| Pers. L              | • 38     |
| PCI                  | 38       |

This varimax factor is characterised by significant loadings for only three variables. Though two variables have positive loadings the remaining one is negatively loaded. The percent common variance covered by this factor was 3.92. This factor is characterised by significant loadings on variables Q<sub>1</sub> .74, Pers.L .38 and PCI -.38. Experimenting, which is found to have high positive loadings. The varimax factor IX can be named "Experimentation".

#### THE VARIMAX FACTOR X

The significant loadings of varimax factor X Are given in Table 5.20.

Table 5.20 : The Varimax Factor X

| Variables | Loadings |
|-----------|----------|
| Pers. B   | •53      |
| Pers. M   | 39       |
| Pers. Q4  | 45       |
| Pers. L   | 62       |

This varimax factor is characterised by significant loadings for only four variables. Though one variable has positive loadings, the remaining three variables are negatively loaded. The percent common variance covered by this factor is 3.89. This factor is characterised by significant loadings on variables Pers. B .53, Pers.M -.39, Pers.  $Q_4$  -.45 and Pers. L -.62. The significant loading was dominated by Trustful, it can be called 'Trustful'.

#### THE VARIMAX FACTOR XI

The significant loadings of varimax factor XI is given in Table 5.21.

Table 5.21 : The Varimax Factor XI.

| Variables | Loadings |
|-----------|----------|
| Dogmatism | •86      |
| Pers. G · | •4 Ö     |

This varimax factor is characterised by significant loadings for only two variables. All the factor loadings are found to be positive. The percent common variance covered by this factor is 3.80. This factor is characterised by significant loadings on variables Dogmatism .86 and Pers.G. 40. The significant loading was dominated by Dogmatism, it can be called "Dogmatism".

### 5.6 CONCLUSION

The factor matrix (vide Table 5.2) comprising four and eleven principal axis components, explains the correlation matrix (12x12) and (30x30) (Vide- Tables 5.1 and 5.8) The naming and interpretation of the rotated varimax factors have shown the composition of the important factors. The factors were named for the Organizational Climate. (1) Thrust and Consideration, (2) Intimacy, (3) Feedback and Non-graded order, and (4) Production Emphasis. One of these four factors, 'Thrust and Consideration' has covered 23.40 per cent of common variance and it has been the most dominating factor. The per cent common variance covered by the factor 'Production Emphasis' was only 11.92 and it was the least dominating factor.

The factors were named for the ten factors extracted out (1) Intimacy and Esprit, (2) Self-Surficient (3) Thrust and Consideration (4) Dominant and Sophisticated (5) Production Emphasis (6) Tough and Confident (7) Silent and Conventional (8) Non-graded order and Mature (9) Experimenting and (10) Trustful, Out of this ten factors 'Intimacy and Esprit' has covered 10.08 per cent of common variance and it has been the most dominating factor. The per cent common variance covered by the'Trustful' was only 3.80 and it was the least dominating factor.

According to the rotated varimax factor matrix and according to the per cent common variance the factors were named as indicated above.
